China Makes Modest Progress in Updated BSA Global Cloud Computing Scorecard's Rankings

New report shows how emerging markets continue to lag in the adoption of cloud-friendly policies, hindering their growth

China —March 6, 2018 — BSA | The Software Alliance today released its 2018 Global Cloud Computing Scorecard, a flagship study that assesses cloud computing policies around the globe. China ranks 22nd out of 24 leading IT economies, one place higher than its ranking of 23rd in 2016. Its ranking continues to be a sign that the legal and regulatory environment for cloud computing in China should be improved to promote restricting innovation. You can see a detailed analysis of China's results [here](#).

The 2018 BSA Global Cloud Computing Scorecard – the newest version of the only global report to rank countries' preparedness for the adoption and growth of cloud computing services – features an updated methodology that better reflects the policies that have helped cloud computing's exponential growth over the past five years, putting additional emphasis on countries' privacy and cybersecurity laws and broadband infrastructure.

In 2018, most countries continue to make improvements, but some markets are falling further behind. Germany scored the highest on the Scorecard – due to its national cybersecurity policies and promotion of free trade – followed closely by Japan and the United States. Bringing up the rear are a small group of nations that have failed to embrace the international approach: Russia, China, Indonesia, and Vietnam.

The Scorecard's key findings include:

- **Advanced privacy and security policies set leading countries apart from lagging markets.** Countries continue to update and refine their data protection regimes, most often in a way that enables cross-border data flows. Several countries, however, still have not adopted adequate privacy laws.
- **Emerging markets continue to lag in the adoption of cloud-friendly policies, hindering their growth.** Examples include regulations that impose significant barriers for cloud service providers, data localization requirements, and a lack of cybersecurity protections.
- **Deviations from widely adopted regimes and international agreements hold back key markets.** Internationally accepted standards, certifications, and testing help improve the security environment for cloud computing, but not every country

recognizes such best practices as meeting local standards.

- **Those few countries that have embraced localization policies pay a heavy price.** Data localization requirements act as a barrier to cloud computing, causing negative financial impacts for local markets.
- **Increased emphasis on IT readiness and broadband deployment leads to interesting results.** The ability of countries and companies to leverage cloud computing for growth requires access to a powerful network. While almost all countries continue to work to improve broadband access, the success of those efforts remains very inconsistent.

China does not follow international models in key areas that are relevant to cloud computing. It achieved the lowest results from all countries in the areas of international standards and it also scored very poorly in the section on free trade promotion. Extensive regulation of Internet content, including mandatory Internet filtering and censorship, remains a key issue in China. China's poor results in relation to laws and regulation were partly offset by strong progress in IT infrastructure, which explains the slight improving in its ranking—from 23rd place to 22nd place.

By examining the legal and regulatory framework of 24 countries, the Scorecard aims to provide a platform for discussion between policymakers and cloud service providers. This dialogue can help develop an internationally harmonized regime of laws and regulations that facilitate cloud computing.

"The Scorecard is a tool that can help countries constructively self-evaluate their policies and determine next steps to increase adoption of cloud computing," said Victoria Espinel, President and CEO of BSA | The Software Alliance. "Cloud computing allows anyone to access technology previously available only to large organizations, paving the way for increased connectivity and innovation. Countries that embrace the free flow of data, implement cutting-edge cybersecurity solutions, protect intellectual property, and establish IT infrastructure will continue to reap the benefits of cloud computing for businesses and citizens alike."

The full, 24-country rankings and detailed findings are available at www.bsa.org/cloudscorecard.

About BSA

BSA | The Software Alliance (www.bsa.org) is the leading advocate for the global software industry before governments and in the international marketplace. Its members are among the world's most innovative companies, creating software solutions that spark the economy and improve modern life. With headquarters in Washington, DC, and operations in more than 60 countries, BSA pioneers compliance programs that promote legal software use and advocates for public policies that foster technology innovation and drive growth in the digital economy. Follow BSA at [@BSAnews](https://twitter.com/BSAnews).
